WO 2005/081131 PCT/GB2005/000627

RENDERING A USER INTERFACE

FIELD OF THE INVENTION

5 The present invention relates to rendering user interfaces and in particular to rendering user interfaces for communications devices.

BACKGROUND OF THE INVENTION

10

15

20

30

Communications devices, such as, for example mobile telephones and PDAs incorporate display screens of increasing size and resolution. Given the limitations in processing power of these devices it is desirable to provide users with an attractive user interface that facilitates the use of the device and provides a fast response to user inputs. For some devices, such as mobile telephones, there is significant interest in providing user interfaces that can be readily and easily updated by the user and/or the network operator so that content for updating user interfaces can be deployed to users. Known approaches tend to either lack the required flexibility or require significant and undesirable levels of processing power.

25 SUMMARY OF THE INVENTION

According to a first aspect of the present invention there is provided a method of rendering a user interface for a device, the method comprising the steps of providing a plurality of actors, each of the plurality of actors being associated with a user interface element and comprising one or more attributes defining the respective actor; providing a

renderer to receive one or more attributes from one or more of the plurality of actors and rendering the user interface in accordance with the received attributes.

5 According to a second aspect of the present invention there is provided a data carrier comprising computer executable code for performing the above-described method.

According to a third aspect of the present invention there is provided a device comprising: a user interface, the user interface comprising one or more user interface elements; a plurality of actors, each of the plurality of actors being associated with a user interface element and comprising one or more attributes; and a renderer, the renderer being configured, in use, to interpret the attributes associated with one or more of the plurality of actors and to render the user interface accordingly.

BRIEF DESCRIPTION OF THE DRAWINGS

20

10

15

Figure 1 shows a schematic depiction of a system incorporating the present invention;

Figure 2 depicts in greater detail the structure and operation of server 100;

25 Figure 3 shows a schematic depiction of the software 400 for the mobile devices 300;

Figure 4 shows a schematic depiction of the content toolset 200; and

Figure 5 shows a schematic depiction of a device that comprises a user interface according to an embodiment of the present invention.

DETAILED DESCRIPTION OF THE INVENTION

25

30

The invention will now be described by way of illustration only and with respect to the accompanying drawings, in which Figure 1 shows a schematic depiction of a system comprising server 100, content toolset 200, mobile devices operational support systems (OSSs) 700, content feeds 500 and user interface (UI) sources 600. In use, the server 100 communicates content data and UI data to the mobile devices 300, 301, ..., each of which comprise software package 400. 10 The server 100 interfaces with OSSs 700, with the OSSs being those conventionally used to operate mobile networks, for example billing, account management, etc. The server 100 further interfaces with the content toolset 200: the content toolset receives data from UI sources 600, 601, ..., and 15 packages the UI data such that the server can transmit the packaged UI data to the software packages 400 comprised within the mobile devices 300. The server receives data from a plurality of content feeds, and this data is processed and packaged such that it can be sent to the software packages 20 400 or so that the mobile devices 300 can access the data using the software package 400.

The system can be envisaged as being divided into three separate domains: operator domain 50 comprises the systems and equipment operated by the mobile network operator (MNO); user domain 60 comprises a plurality of mobile devices and third-party domain 70 comprises the content feeds and UI feeds that may be controlled or operated by a number of different entities.

Figure 2 depicts in greater detail the structure and

WO 2005/081131 PCT/GB2005/000627

operation of server 100. Server 100 comprises publishing component 110 and content server component 150. Publishing component comprises database 111, import queue 112, content toolset interface 113, user interface 114 & catalogue 115.

5 In operation, the publishing component receives content from the content toolset at the content toolset interface. The content is presented in the form of a parcel 210a, 210b, etc, (see below) comprising one or more Trigs and one or more Triglets. A trig is a user interface for a mobile device, such as a mobile telephone and a triglet is a data file that can be used to extend or alter a trig. If a parcel comprises more than one trig then one of the Trigs may be a master trig from which the other Trigs are derived.

Figure 3 shows a schematic depiction of the software 400 for the mobile devices 300, which comprises a mark-up language renderer 410, update manager 420, network communication agent 425, resource manager 430, virtual file system 435, actor manager 440, a plurality of actors 445a, 445, ..., native UI renderer 450, support manager 460, trig manager 465 and mark-up language parser 470.

The software may operate using TrigML, which is an XML application and that mark-up language renderer 410 renders the TrigXML code for display on the mobile device 300. The mark-up language renderer also uses the TrigML Parser to parse TrigML resources, display content on the device screen and controlling the replacement and viewing of content on the handset. The native UI renderer is used to display UI components that can be displayed without the use of TrigML, and for displaying error messages.

25

30

WO 2005/081131 PCT/GB2005/000627

The software 400 is provisioned and installed in a device specific manner. Similarly, software upgrades are handled in a device specific manner. The software may be provisioned in a more limited format, as a self-contained application that renders its built in content only: i.e. the software is provisioned with a built-in trig but additional trigs cannot be added later. The supplied trig may be upgraded over the air.

The trig manager 465 presents an interface to the resource manager 430 and the mark-up language renderer. It is responsible for trig management in general. This includes: persisting knowledge of the trig in use, changing the current trig, selection of a trig on start-up, selection of a further trig as a fall back for a corrupt trig, maintaining the set of installed trigs, identifying where a particular trig is installed to the resource manager and reading the update channel definitions of a trig and configuring the update manager appropriately.

20

The resource manager provides an abstraction of the persistent store on device, i.e. storing the files as real files, or as records in a database. The resource manager presents a file system interface to the mark-up language renderer and the update manager. It is responsible for handling file path logic, distinguishing between real resource files and actor attributes, mapping trig-relative paths onto absolute paths, interfacing with the trig manager and providing a modification interface to the update manager.

30

25

The Resource Manager is also responsible for ensuring the integrity of the resources stored in the persistent store,

especially in the face of unpredictable interruptions such as loss of device power. The Resource Manager has no knowledge of the trig currently used. Its interface is thread safe (as it may be used by both the Update Manager and the Renderer from different threads.

The Update Manager handles the reception and application of Trigs and Triglets. The Update Manager presents an interface to the Renderer and the trig Manager and is responsible for: the initiation of manual updates when instructed to by the Renderer; controlling and implementing the automatic update channel when so configured by the trig manager; indicating the progress of a manual update and recovering an Update following unexpected loss of network connection and/or dewice power. The update packet format may be defined as a binary serialisation of an XML schema.

10

15

20

The Support Manager provides an interface for other components to report the occurrence of an event or error. Depending on the severity of the error, the Support Manager will log the event and/or put up an error message popup

XML is a convenient data formatting language that is used to define the update packet format as well as TrigML content.

25 For bandwidth and storage efficiency reasons, text XML is serialised into a binary representation. Both update packets and TrigML fragments are parsed by the same component, the mark-up language parser. Any further use of XML in the software must use the binary XML encoding and therefore re-

The Actor Manager 440 looks after the set of actors 445

WO 2005/081131 PCT/GB2005/000627

present in the software. It is used by: the renderer when content is sending events to an actor; actors that want to notify that an attribute value has changed and actors that want to emit an event (see below).

5

10

15

The software may comprises a multi-threaded application running a minimum of two threads, with more possible depending on how many and what sort of actors are included. The software runs mostly in one thread, referred to as the main thread. The main thread is used to run the renderer which communicates synchronously with other components. Actors always have a synchronous interface to the Renderer. requires additional threads for actor Ιf an functionality, then it is the responsibility of the Actor to manage the inter-thread communication. A light messaging framework may be used to avoid unnecessary code duplication where many actors require inter-thread communication. It will be understood that it is also possible to implement the software using a single threaded operation.

20

In addition to the main thread, the update manager runs a network thread. The network thread is used to download update packets and is separate from the main thread to allow the renderer to continue unaffected until the packet has arrived. The Update Manager is responsible for handling inter-thread messaging such that the Update Manager communicates synchronously with the Renderer and Resource Manager when applying the changes defined in an Update Packet.

30

25

The memory allocation strategy of the software is platform specific. On MIDP platforms, the software simply uses the

WO 2005/081131 PCT/GB2005/000627

system heap and garbage collector for all its memory requirements. Garbage collection is forced whenever a content replacement event occurs in an attempt to keep the garbage collection predictable and not suffer unexpected pauses in operation. It is assumed that any memory allocation might fail, in which case the software will delete all its references to objects, garbage collect, and restart - assuming that the software has already successfully started up and rendered the first page.

10

15

20

25

30

On C++-based platforms, a mixture of pre-allocation and on-demand allocation will be made from the system heap. All memory required for start-up is allocated on-demand during start-up, with any failures here causing the exit with message if possible) of the software. Following successful start-up, memory needed for rendering the content document model is pre-allocated. Provided content is authored to use less than a defined limit, it is guaranteed to render. Additional use is made of RAM for various caches needed for fast operation of the software. Where memory conditions are low, these caches will be released resulting in slow rendering performance from the software.

Errors that are severe enough to disrupt the normal operation of the software must result in a pop-up dialog box. of a small number of dialog box contains one internationalised error messages (internationalised versions of these strings may be compiled into the software at buildtime with the version of an error string to display being determined by the relevant language setting on the device). To keep the number of messages to a minimum, only a few generic problems are covered.

To allow for support situations, error dialogs also display an error code as a 4-digit (16-bit) hex string. Each error code is associated with a description text that can be used by support staff to determine the nature of a problem with the software. Errors that occur in the software and that are not severe enough to halt its operation may be logged by the Support Manager component. The Support Manager can be queried by the user typing special key sequences. The Support Manager can also supply its error log to a server via an HTTP GET or POST method.

10

The Renderer receives information regarding the key press. If there is no behaviour configured at build time for a key, it is sent as a TrigML content event to the current focus element. The content event is then handled as defined by TrigML's normal event processing logic.

For example, if a key is pressed down, a 'keypress' event is delivered to the Renderer with a parameter set to they relevant key. When the key is released, a '!keypress' event is delivered to the Renderer. If a key is held down for a extended period of time, a 'longkeypress' event is delivered to the renderer. On release, both a '!longkeypress' and a '!keypress' event are delivered to the Renderer.

Whenever the software is started, it executes the following actions:

- Check for, and continue with, interrupted Update
 processing;
 - Check for, and process, Updates residing in the file system (either pre-provisioned, or installed to the file

system by some other means);

5

15

20

25

30

- If known, start the current trig (which may be the last run trig);
- If a current trig is not set, a trig that has been flagged as a 'default' trig can be started.
- Failing the presence of a default trig, the first valid trig by alphabetical order of name will be selected.

A trig is started by loading the defined resource name, start-up/default. The TrigML defined in start-up/default is parsed as the new contents for the content root node.

The first time a trig is run by the software following its installation, the trig is started by loading the resource name startup/firsttime. The software may record whether a trig has been run or not in a file located in the top level folder for that trig. Dependent on the platform used by the mobile device, the automatic start-up of the software may be set as a build-time configuration option. Furthermore, placing the software in the background following an autostart may also be a build-time configuration option.

A launcher may appear to the user as an application icon and selecting it starts the software with a trig specified by that launcher (this trig may be indicated by a launcher icon and/or name). When using a launcher to start a trig, it is possible to specify an 'entry point' parameter. The parameter is a resource name of a file found in the 'start-up' folder. This file is not used if the trig has never been run before, in which case the file called 'firsttime' is used instead.

The software uses content resource files stored in a virtual

WO 2005/081131 PCT/GB2005/000627
- 11 -

file system on the device. The file system is described as virtual as it may not be implemented as a classical file-system, however, all references to resources are file paths as if stored in a hierarchical system of folders and files.

5

Details regarding the arrangement of the file-system for an embodiment of the present invention are given below in Appendix A. Furthermore, the software stores some or all of the following information: usage statistics; active user counts; TrigManager state; TrigML fragments & update channel definition (serialised as binary XML); PNG images; plain text, encoded as UTF-8 OTA and then stored in a platform specific encoding; other platform specific resources, e.g. ring tone files, background images, etc.

15

20

25

10

Files in the file system can be changed, either when an actor attribute value changes, or when a file is replaced by a triglet. When files in the /attrs directory change, the Renderer is immediately notified and the relevant branches of the content tree are updated and refreshed. When images and text resources are changed, the Renderer behaves as if the affected resources are immediately reloaded (either the whole content tree or just the affected branches may be refreshed). When TrigML fragments are changed, the Renderer behaves as if it is not notified and continues to display its current, possibly out of date, content. This is to avoid the software needing to persist <include> elements and the <load> history of the current content.

30 The software 400 is provisioned to mobile devices in a device specific method. One or more Trigs can be provisioned as part of the installation, for example, stored as an

WO 2005/081131

PCT/GB2005/000627

- 12 -

uncompressed update packet. On start-up, the packet can be expanded and installed to the file-system.

The Actors 445 are components that publish attribute values and handle and emit events. Actors communicate with the Renderer synchronously. If an actor needs asynchronous behaviour, then it is the responsibility of the actor to manage and communicate with a thread external to the main thread of the Renderer.

10

Actor attributes may be read as file references. Attributes are one of four types: a single simple value; a vector of simple values; a single structure of fields, each field having a simple value; or a vector of structures. Attributes may be referenced by an expression using an object member notation similar to many object-orientated programming languages:

<image res="signallevels/{protocol.signalstrength}"/>

20

15

When needed as a file, an attribute is accessed via the /attrs folder.

<text res="/attr/network/name">

25

30

An Actor can be messaged by sending it an event with the <throw> element. Events emitted by actors can be delivered to the content tree as content events: these can be targeted at an element Id or 'top'. The interface to an actor is defined by an Actor Interface Definition file. This is an XML document that defines the attributes, types, fieldnames, events-in and parameters, and events out. The set of actors

is configurable at build-time for the software. Appendix B gives an exemplary listing of some actors that may be used, along with the associated functions or variables.

5 Updates comprise a new trig (a new or replacement UI) or a triglet (a modification to an existing trig) and may be regarded as modifications to the software file-system. The Update Manager to determine what needs changing in the file-system by reading a packet. Update Packets may be downloaded over the air by the software 400 using HTTP, or other suitable transport mechanisms, wrapped in a device-specific package format or pre-provisioned with the installation of the software itself.

15 Updates may be triggered by a number of means, which include

- the software checking for interrupted Update processing on start-up
- the software checking for pre-installed Update Packets on start-up
- automatically as configured by an Update Channel
 - user initiation
 - the device receiving a special SMS

In order to successfully render the user interface of a mobile device, the mark-up language must have the following qualities: concise page definitions, consistent layout rules, be implementable in a compact renderer, provide multiple layering and arbitrary overlapping content, event model, require the repaint of only the areas of the display that have to change between pages of the UI, include hooks to the platform for reading property values receiving events and sending events, extensible, and be graphically flexible.

WO 2005/081131 PCT/GB2005/000627 - 14 -

TrigML provides these features and Appendix C gives an overview of the elements and attributes that provide the desired functionality.

5 It is desirable that the cost of re-branding UIs and producing a continual stream of updates is minimal. This is enabled by providing an efficient flow of information from the creative process through to the transmission of data to users.

10

15

25

A container, referred to as a parcel, is used for UIs, UI updates, and templates for 3rd party involvement. Parcels contain all the information necessary for a 3rd party to produce, test and deliver branded UIs and updates. Figure 4 shows a schematic depiction of the content toolset 200, which comprises scripting environment 220, test and simulation environment 230 and maintenance environment 240

The parcel process comprise five processing stages:

- 1) The scripting environment 220 provides the means to design the template for one or more UIs and the update strategy for UIs based on that template.
 - 2) The maintenance environment 240 provides for rapid UI and update production in a well-controlled and guided environment that can be outsourced to content providers.
 - 3) The maintenance environment 240 'pre-flight' functionality allows the deployment administrator to check and tune the UIs and updates that they receive from 3rd parties.
- 4) The publishing component 110 provides management of UIs and updates at the deployment point, including the staging of new releases.
 - 5) The publishing component 110 enables the automatic

generation of updates from live content feeds.

10

Many different UIs can be derived from a common base. Typically the common base would implement most of the interface itself, and Trigs derived from it would implement small variations on it, such as branding. A Triglet can be derived from a Trig, and it can override any of the resources from the parent Trig that it chooses to (optionally it may introduce its own resources). Note that "resources" here also refers to TrigML, so the behaviour and layout of a Trig can be modified by a Triglet just as easily as it replacing a single image or piece of text.

A Parcel may comprise one or more base Trigs (i.e. actrig that is not derived from any other trig), one or more multiple Trigs derived from a base Trig, a plurality of triglets derived from any of the trigs and a plurality of triglets derived from other triglets.

- Figure 5 shows a schematic depiction of a device 800 that comprises a user interface according to an embodiment of the present invention. The device comprises a display 810 that displays the user interface 815 and user interface means 820, that enable the user to interact with the user interface 815.
- A processor 830 executes the software that is stored within one or more storage means 840 and there may be provided one or more wireless communication interfaces 850, to enable communication with other devices and/or communication networks. One or more batteries 860 may be received to power the device, which may also comprise interfaces to receive electrical power and/or communication cables.

WO 2005/081131 PCT/GB2005/000627 - 16 -

The nature of these components and interfaces will depend upon the nature of the device. It will be understood that such a user interface can be implemented within a mobile or cellular telephone handset, but it is also applicable to other portable devices such as digital cameras, personal digital organisers, digital music players, GPS navigators, portable gaming consoles, etc. Furthermore, it is also applicable to other devices that comprise a user interface, such as laptop or desktop computers.

10

15

20

The user interface means may comprise a plurality of buttons, such as a numerical or alpha-numerical keyboard, or a touch screen or similar. One or more storage devices may comprise a form of non-volatile memory, such as a memory card, so that the stored data is not lost if power is lost. ROM storage means may be provided to store data which does not need updating or changing. Some RAM may be provided for temporary storage as the faster response times support the caching of frequently accessed data. The device may also accept user removable memory cards and optionally hard disk drives may be used as a storage means. The storage means used will be determined by balancing the different requirements of device size, power consumption, the volume of storage required, etc.

Such a device may be implemented in conjunction with virtually any wireless communications network, for example second generation digital mobile telephone networks (i.e. GSM, D-AMPS), so-called 2.5G networks (i.e. GPRS, HSCSD, EDGE), third generation WCDMA or CDMA-2000 networks and improvements to and derivatives of these and similar networks. Within buildings and campuses other technologies such as Bluetooth, IrDa or wireless LANs (whether based on

WO 2005/081131 PCT/GB2005/000627 - 17 -

radio or optical systems) may also be used. USB and/or FireWire connectivity may be supplied for data synchronisation with other devices and/or for battery charging.

5

Computer software for implementing the methods and/or for configuring a device as described above may be provided on data carriers such as floppy disks, CD-ROMS. DVDs, non-volatile memory cards, etc.

10

This application claims the benefit of UK Patent Application number 0403709.9, filed February 19th 2004, the contents of which are incorporated herein by reference.

APPENDIX A

For file paths beginning with a leading '/':

5

/attrs	Like the unix /proc directory,
	stores actor attribute values
	for reference by content when
	the attribute is needed as a
	file reference.
<actor></actor>	Each subdirectory of /attrs is
	the actor name.
<attribute></attribute>	Each attribute is accessed as a
	node in the actor subdirectory
<field></field>	If the attribute is a
	structure, then the field name
	specifies which structure
	member to access.
<index></index>	If the attribute is a vector
	attribute, then the index
	number specifies the index into
	the vector of the desired
	attribute.
<field></field>	If the vector attribute is a
	collection of structures, then
	the field name again specifies
	the structure member.

File paths without a leading '/' are treated as relative to the current trig, i.e. every trig is stored in its own folder hierarchy rooted in a single folder.

WO 2005/081131 PCT/GB2005/000627 - 19 -

config	Common folder in every trig to
	• •
	store trig meta data.
channels	Common folder to store the update
	channel definitions.
<channel defs=""></channel>	Set of files defining the
	collection of update channels for
	the trig. Each file can define
	one or more update channels.
start-up	Common folder to store entry
	points for the trig.
default	Common TrigML file to store the
	default entry point for the trig.
firsttime	Common TrigML file to store the
	TrigML for use the first time
	this trig is run
<trigml files=""></trigml>	Other named TrigML files can be
	used as entry points if found in
	the start-up folder.
constants	This folder is not passed OTA and
	is instead fully resolved at
	content compile time.
<rest content="" of=""></rest>	trig content is organised in
	trig-defined format under the
	Trigs folder.

			its <layer>. If more than one</layer>				
			element specifies raise=true,				
			then they are all painted				
			last, but in their normal				

			relative order.
			If false, the painting of this
			element is in the normal order
			- that of painting elements in
			the order parsed.
hasfocus	boolean	false	If true, this element will be
			given the initial focus for
	j		the layer that it is in. If
			more than one element
			specifies hasfocus=true, then
			the last within each layer to
			do so is given the initial
			focus. When loading new
	1		content that contains an
		}	element with hasfocus=true,
			the focus is only given to
			this element if the new
			content is removing the
		,	element that previously had
			the focus.
canfocus	boolean	false	If true, this element will be
			given the focus when
			navigating with the cursor
			keys.
		}	If false, this element will be
			ignored when navigating with
			the cursor keys.
			(Note: This replaces: <att< th=""></att<>
			when=focus/>)

<trigml>

The root element of all TrigML documents. It does not have any

contains contained by visual appearance.

any element none

attributes type default

none

<layer>

contains

any visible any listener contained by

_top

Full screen layer. Each layer its own focus. manages highest layer with a non-null focus element gets keypresses and events sent to _top.

attributes type default

id string none

The name or ID of this element. This identifier is used, in the target attribute of <throw> and <load> elements. If the same ID is used more than once, then the last ID loaded is used.

<group> Generic container of other visible, container elements. Can be used as a plain contains contained by rectangle. any visible any container any listener attributes type default all attributes in type: visible

<grid></grid>		Cont	ainer	element	that ar	ranges
ļ	v i sible, container	its	childr	ren in a	grid.	<grid></grid>
contains	contained by	is	purely	y for	layout	. Use

any visible	any con	tainer	<pre><gridlist> or <griddata> for</griddata></gridlist></pre>
any listener			focus management. Each child is
			placed in its cell, with that
			cell forming its parent frame -
			i.e. children that leave w/h as
			'*' will be the size of their
			cell.
attributes	type	default	
rows	integer	none	The number of rows in the grid.
			Cannot be zero. If rows is
		}	supplied and cols is not, then
			the grid is filled column by
			column.
cols	integer	none	The number of columns in the
			grid. Cannot be zero. [If cols
	1		is supplied and rows is not,
			then the grid is filled row by
	,		row. If both rows and cols are
			supplied, then the grid is also
			filled row by row.
rowsplit	list of	*	The heights of each row. If
	semi-		fewer values are supplied than
3	colon		there are rows, the last value
	separated		is repeated for each extra row.
	integers		All rows that have * for a
	or *s		rowsplit share the available
			space.
colsplit	same as	*	The column width equivalent of
	rowsplit		rowsplit.
			Note that clip applies to the
all attributes in			whole grid, not each cell in
type: visible			the grid.
 	<u> </u>		

<gridlist></gridlist>			Container element that arranges				
,	visible, c	ontainer	its children in a grid. It is				
contains	contained by		also a Focus Manager in that it				
any visible	any container		moves an active cell around the				
any listener			grid, scrolling the grid if the				
			grid is bigger than the frame of				
	}		this element. Note that both				
			rows and rowsplit, and cols and				
			colsplit, must be supplied to				
			achieve a grid that is larger				
			than the w/h of this element.				
attributes	type	default	·				
initrow	integer	0	The initial row of the active				
			cell. Count from zero. See				
			initcol below.				
initcol	integer	0	The initial column of the active				
			cell. Count from zero. The first				
			time the gridlist gets focus,				
			this is the cell that is in turn				
			given focus. The hasfocus				
!			attribute overrides initrow and				
}			initcol.				
all attributes in		'					
<grid></grid>

<text></text>		Draws a text string. Text	
		visible	can be single or multiline,
contains	contained by		scrollable or not, editable
any listener	any co	ntainer	or not. Text is drawn with
			device specific fonts.
attributes	type	default	
res (modifiable)	resource	none	The resource path of the
	path		text string to display
			(initially if editable). A
			transparent blank is drawn
			if not supplied.
font	fixed	serif	Device specific font.
	serif		
	sansserif		ŕ
	system		
size	small	small	Device specific size. Should
	medium		map to 9pt, 12pt and 18pt
	large		respectively.
weight	plain	plain	Device specific weight for
	bold		the font.
slant	plain	plain	Device specific weight for
	italic	li i	the font.
align	left	left	The horizontal alignment of
	centre	,	the text string inside the
	center		frame of the text box. There
	right		is no vertical alignment
			control, use the y attribute
			to control the text box
			position instead.
color, colour	colour	#ff000000	The colour of the text. If
(modifiable)		(black)	translucent alpha is not
			supported, the alpha
			component is rounded up to
			full opacity.

fxcolor, fxcolour	colour	#00000000	The colour of the text
(modifiable)			effect. The default text
			effect is a glow background.
multiline	boolean	false	If false, the string is
			drawn on a single line. The
			width of this element will
			default to the length
			required to exactly fit the
			string.
			If true, the string will be
		;	drawn on multiple lines. The
			width will default to be the
			same as the parent element.
			The height will default to
			the height required to
			exactly fit the number of
			lines for the string.
scrollable	boolean	false	If true, the view of the
			string can be scrolled
			(horizontally for single
			line, vertically for
			multiline) when this element
			has the focus. Focus is
			released when the end or
			beginning of the string is
			reached, or if a cursor key
			is pressed in the non-
			scrolling direction.
editable	resource	None	If supplied, this element is
	path to		an editable text box. Text
	writable		editing is drawn in a device
	resource		specific way, and may
			involve pressing select to
			activate text editing. The
			edited value of the string

		path	stor h ribut	supp		this
all attributes in type: visible					 	

<throw></throw>			Throws an event. Events can be
		listener	sent to other parts of the
contains	contained	by	content tree or to an actor.
<param/>	any vi	sible	
attributes	type	default	,
when	event	none	The event to listen form If a
	name and		parameter value is supplied in
	optional		square brackets [], then this
	parameter		will only trigger when the
	value		event with that parameter value
			is received. E.g.:
			when="keypress[_select]"
			triggers on the keypress event
			when the parameter value is
			`_select'
event	event	none	The name of the event to throw.
	name		If this is an Actor event, it
			will automatically be sent to
,			the relevant Actor, regardless
			of the specified target. Use
			square brackets to specify an
			anonymous parameter value to
			accompany this event. Use
			<pre><param/> children to specify</pre>
			named parameters for this
			event.

			If the event is the 'focus' event, then this will cause the focus to move to the target element (within the layer of the target element).
target	element ID	_top	The element ID of the element to send this event to. If not supplied then _top is used. If the event is an Actor event, this attribute is ignored.
consume	boolean	false	If true, the event propagation will stop at this element. No further listeners will trigger on the incoming event after this element.

<att></att>			Modifies an attribute of its
	listener		parent <i>visible</i> when switched
contains	contained by		on. <att> is switched on by the</att>
	any vis	sible	event specified in the when
			attribute. It is switched off
			by the '!' version of the
			event. If several <att>s modify</att>
			the same parent attribute, the
			last <att> that is switched on</att>
			wins.
attributes	type	default	
when	event	none	The event to listen for. If a
	name and		parameter value is supplied in
	optional		square brackets [], then this
	parameter		will only switch on when the
	value		event with that parameter value
			is received. E.g.:
			when="keypress[_select]"
			triggers on the keypress event

			when the parameter value is '_select'
name	attribute name	none	The name of the attribute in the parent visible to modify. The attribute must be modifiable as indicated in the attribute boxes in this spec.
value	same as attribute being modified	none	The new value for the named attribute of the parent visible. Use the @-symbol to reference the value of a named parameter of the incoming event.
consume	boolean	false	If true, the event propagation will stop at this element. No further listeners will trigger on the incoming event after this element.

<anim></anim>			Continuously modifies an
		listener	attribute of its parent
contains	contained by		visible while switched on.
	any visi	ble	The animation is started by
			the event, and restarted
			every time the event arrives
			subsequently. The
			modification (whereever the
			animation has got to) is
			switched off when the '!'
:			version of the event arrives.
attributes	type	default	
when	event name	none	The event to listen for. If a
	and optional		parameter value is supplied
	parameter		in square brackets [], then
	value		this will only switch on when

			the event with that parameter
		,	value is received. E.g.:
			when="keypress[_select]"
			triggers on the keypress
			event when the parameter
			value is `_select'
name	attribute	none	The name of the attribute in
	name		the parent <i>visible</i> to modify.
		i	The attribute must be
			modifiable as indicated in
			the attribute boxes in this
		ļ.	spec.
startvalue	same as	none	The value to use at the start
	attribute		of the animation. If not
	being		supplied, the currents value
	modified		is used. The current value
			depends on all previous
			listener elements that modify
			the same attribute and the
			value specified by the parent
			visible itself.
endvalue	same as	none	The value to use at the end
	attribute		of the animation. This value
	being		is reached at the time
	modified		specified by the duration
			attribute. If not supplied,
			the current value of the
			attribute is used in the same
			way as startvalue above.
duration	integer	300	The length of time taken to
}	number of		animate the named attribute
	milliseconds		from startvalue to endvalue
			once. Note this is not the
			total duraction of the
			animation which can be

			calculated by multiplying the
			number of repeats by this
	,		duration.
repeat	integer	0	The number of times to repeat
	-1 =forever		the animation after the first
			time through, i.e. setting it
			to 1 will result in the
			animation being played twice.
bounce	boolean	false	If true, the animation will
			play backwards on alternate
	'		repeats.
persist	boolean	depends	If true, the animation will
			hold the endvalue as the
			modification until switched
			off by the '!' event.
			If false, the animation will
			revert to the startvalue at
			the end of the animation and
			hold that value until the
		ļ	animation is switched off.
			The default depends whether
			the event is a normal event
			or a '!' version of an event.
			If the event is normal, the
			default is true. If the event
			is a '!' event, the default
			is false.
consume	boolean	false	If true, the event
			propagation will stop at this
			element. No further listeners
			will trigger on the incoming
			event after this element.

<load></load>			Loads some new content into the
		listener	supplied target element.
contains	contained by		
<param/>	any vis	sible	
attributes	type	default	
when	event	none	The event to listen for. If a
	name and		parameter value is supplied in
	optional		square brackets [], then this
	parameter		will only trigger when the
	value		event with that parameter value
			is received. E.g.:
			when="keypress[_select]"
			triggers on the keypress event
			when the parameter value is
			`_select'
res	resource	none	The resource path of the trigml
	path		file to load.
target	element	_top	The element ID to replace the
	ID		children of.
consume	boolean	false	If true, the event propagation
·			will stop at this element. No
			further <i>listeners</i> will trigger
			on the incoming event after
			this element.

<include></include>			Inlines the specified trigml
			file. The trigml in the file is
contains	contained	l by	treated as if it had been
<param/>	any el	ement	originally declared in place of
			this <include> element.</include>
attributes	type	default	
res	resource	none	The resource path of the trigml
	path		file to include.

<pre><param/></pre>			Supplies a parameter name and
		Į.	value to a <load>, <include> or</include></load>
contains	contained by		<throw> element.</throw>
	<loa< th=""><th>d></th><th></th></loa<>	d>	
	<incl< th=""><th>ıde></th><th></th></incl<>	ıde>	
	<thre< td=""><td><wc></wc></td><td></td></thre<>	<wc></wc>	
attributes	type	default	
name	parameter	none	The name of the parameter.
	name		The \$-symbol is used to
			reference the parameter when
			used in a <load> or <include>.</include></load>
			The @-symbol is used to
			reference the parameter when
			used with an event.
value	value	none	The value of the parameter:
valuefrom	resource	none	The resource path of a file to
	path		read the contents of to obtain
			the value of this parameter.

<setvar></setvar>			Sets a variable. The variable can
<pre><setval></setval></pre>			
		listener	only used when loading new content.
contains	contained	by	If <setvar> triggers on the 'entry'</setvar>
<param/>	any vis	sible	event, the variable cannot be used
			until the next <load> tag is used.</load>
attributes	type	default	
when	event	none	The event to listen for. If a
	name and		parameter value is supplied in
	optional		square brackets [], then this will
	parameter		only trigger when the event with
	value		that parameter value is received.
			E.g.: when="keypress[_select]"
			triggers on the keypress event when
			the parameter value is '_select'
name	variable	none	The name of the variable.
	name		

value	value	none	The value to put in the variable.
			The variable can be referenced with
			the \$-symbol in subsequent <load></load>
	ı		actions.
consume	boolean	false	If true, the event propagation will
			stop at this element. No further
			listeners will trigger on the
	E.		incoming event after this element.

<paintif></paintif>			Only paints its contents if the
	container,	visible	specified resource exists or the
contains	contained	by	path is valid. The contents are
any visible	any el	ement	still in the tree, and still respond
any listener			to events, however, none of the
_			contents are painted fix the
			condition is not met. <paintif> can</paintif>
			be used in place of group.
attributes	type	default	
res	resource	none	The resource path to test for the
	path		existence of.
isvalid	resource	none	The resource path to test the
	path		validity (as a resource path) of.
			Note this will not actually check if
			the file exists, merely whether or
			not the path is a valid path. This
		1	is useful for testing whether \$\$ is
			in range or not.

<ticker></ticker>		Scrolls	а	series	of	items	onto,
	visible	then o	off,	the	fra	me of	this
contains	contained by	element	. T	he visik	ole d	child e	lement

any listener	any co	ntainer	of <ticker> is used as a template</ticker>
any one		:	for each item. Each item is
visible			scrolled on from below the element
		ļ	up into a centre-left-aligned
			position. The item is then paused
			before scrolling it off to the
			left. Use the \$\$ variable in the
			template to vary the item on each
			scroll past. The list is restarted
			at the top when the last item has
			been scrolled past.
attributes	type	default	
repeatover	resource	No	Specifies the set of values to use
	path	default.	for the \$\$ variable in the child
		Must be	elements. If the resource path is
		supplied.	a folder, then the list of
<u> </u>			resources found in that folder are
			used (in numeric order) for the
			set of values for \$\$. If the
			resource path is a file, then the
			file is treated as an index file
			that specifies a list of values
	ļ		for \$\$.
